FU16 Porcupine

Marine Institute UWTV Surveys (2012-2023)

Stock development over time

Porcupine (FU16):

A long, complex history of fishing:

1981 – 1985 Highest Landings
(3717 t 1981-85 5yr \bar{x})

Contrasts:

- late 1970s (1807 t 1975-79 \bar{x})
- early 1990s (1904 t 1989-93 \bar{x})
- early 2000s (1186 t 2000-04 \bar{x})
- late 2000s (1068 t 2004-08 \bar{x})

A series of seasonal closures ensued

2022 landings: 2846t

Fishing pressure on the stock is above F_{MSY} , and no reference points for stock size have been defined for this stock.

Landings

Fishing pressure

Stock size

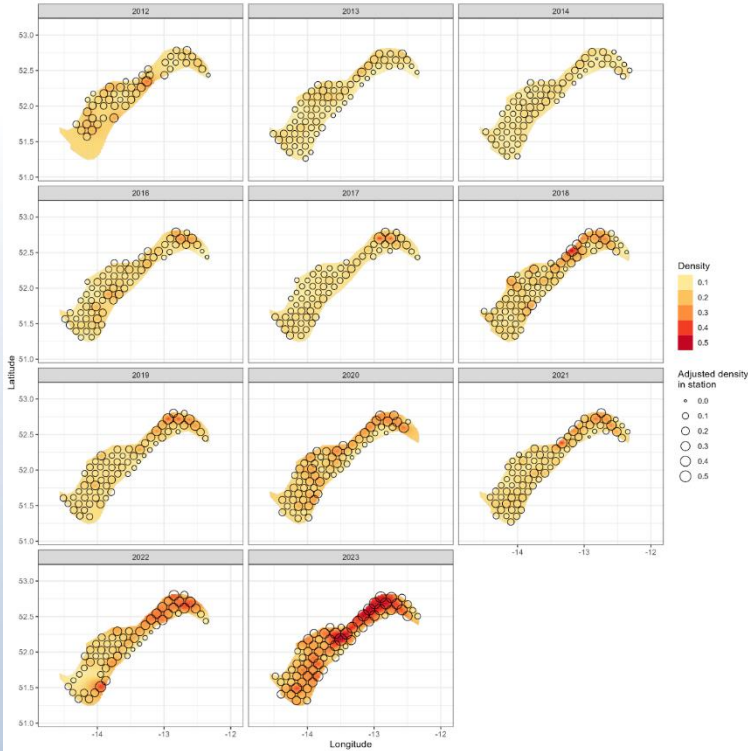

Figure 1

Norway lobster in divisions 7.b–c and 7.j–k, Functional Unit 16. Summary of the stock assessment. Landings (between 1979–2015 discarding is considered negligible; from 2016 onwards, discards are not quantified), harvest rate (sum of landings in numbers, divided by stock abundance), and stock abundance (underwater TV survey). The harvest rate in 2015 was calculated using an interpolated value for abundance, as no survey data are available. Harvest rates since 2016 may be underestimated because of the unknown discard levels.

*Including landings advice for other rectangles

FU14 - Irish Sea, East

Stock development over time

Fishing pressure on the stock is below F_{MSY} , and stock size is below $MSY B_{trigger}$.

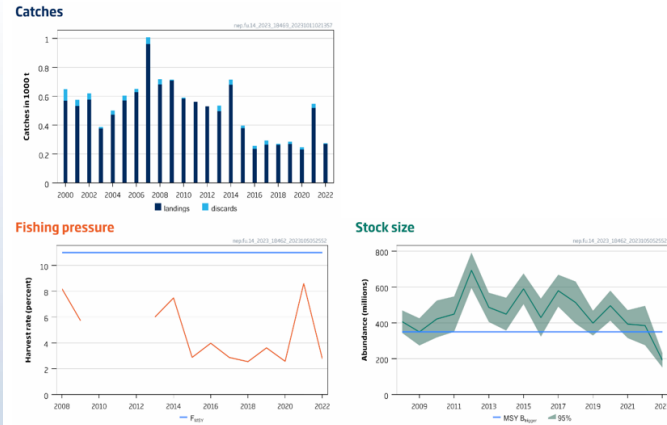

Figure 1 Norway lobster in Division 7.a, Functional Unit 14. Summary of the stock assessment. Catches, harvest rate (sum of landings and dead discards in numbers, divided by stock abundance), and stock abundance (underwater TV survey). No reliable harvest rate estimates exist for the period 2010–2012 because of insufficient catch sampling.

FU15 - Irish Sea, West

Stock development over time

Fishing pressure on the stock is below F_{MSY} , and stock size is above $MSY B_{trigger}$.

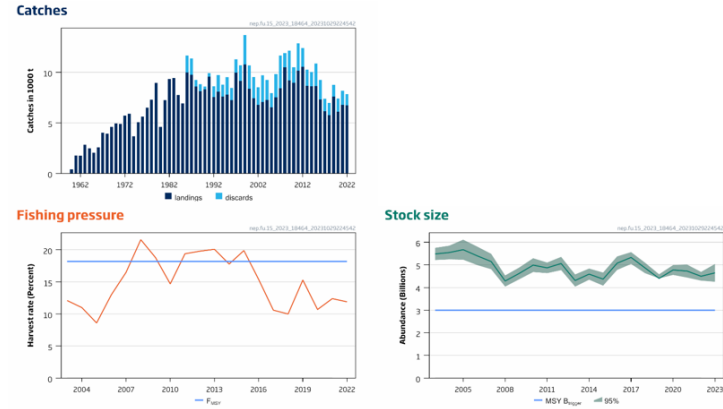

Figure 1 Norway lobster in Division 7.a, Functional Unit 15. Summary of the stock assessment. Catches (discard data are only available since 1996), harvest rate (sum of landings and dead discards in numbers, divided by stock abundance), and stock abundance (underwater TV survey). Harvest rates between 2003 and 2006 may be underestimated because of under-reporting of landings.

FU22 - Smalls

Stock development over time

Fishing pressure on the stock is below F_{MSY} , and stock size is below $MSY B_{trigger}$.

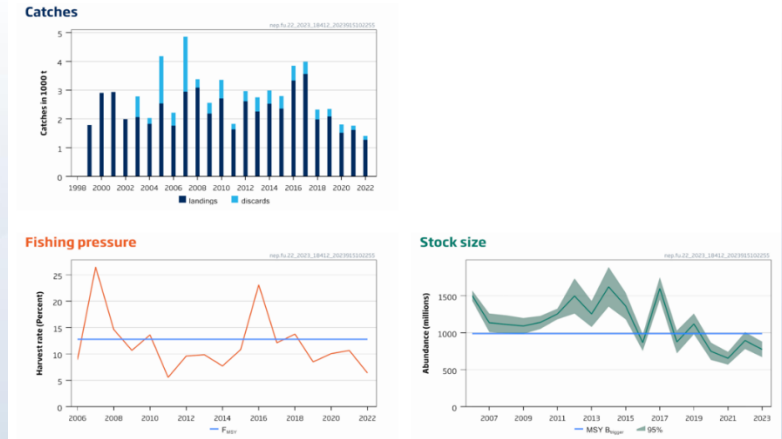

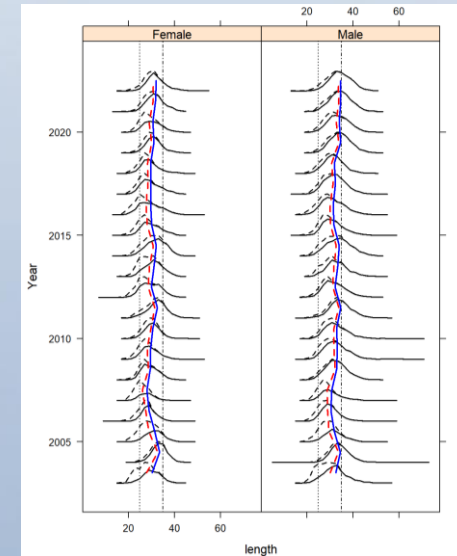

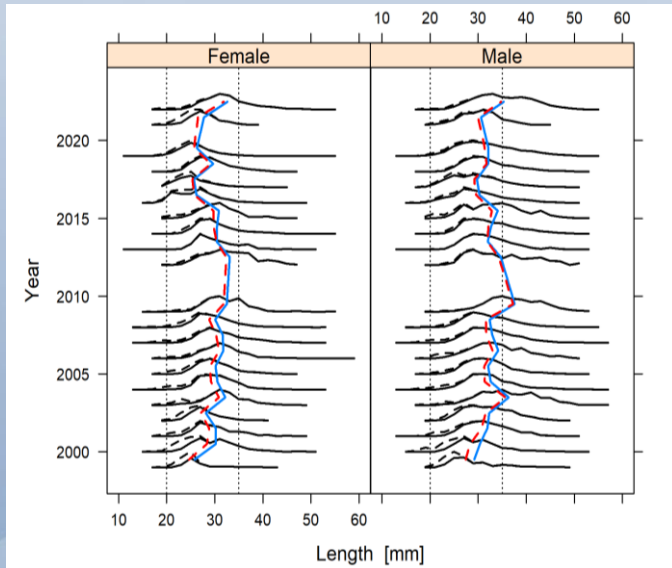

Figure 1 Norway lobster in divisions 7.g and 7.f, Functional Unit 22. Summary of the stock assessment. Catches (discard data only available from 2003), harvest rate (sum of landings and dead discards in numbers, divided by stock abundance), and stock abundance (underwater TV survey).

Length–frequency distributions - mean length of catches (red, dashed) and landings (blue, solid)

FU17 - Aran, Galway Bay, Slyn head

Stock development over time

Fishing pressure on the stock is above F_{MSY} , and stock size is below $MSY B_{trigger}$.

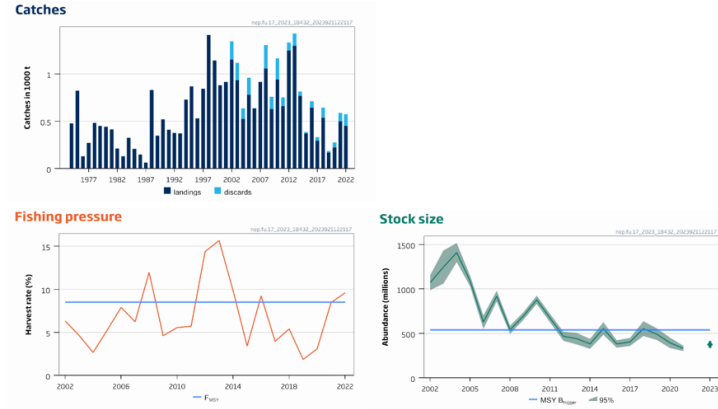

Figure 1 Norway lobster in Division 7.b, Functional Unit 17. Summary of the stock assessment. Catches (discard data are only available since 2002), harvest rate (sum of landings and dead discards in numbers, divided by stock abundance), and stock abundance (underwater TV survey). The harvest rate in 2022 was calculated using an interpolated value for abundance, as no survey data are available.

FU 19 - SW and SE Coast

Stock development over time

Fishing pressure on the stock is below F_{MSY} , and stock size is below $MSY B_{trigger}$.

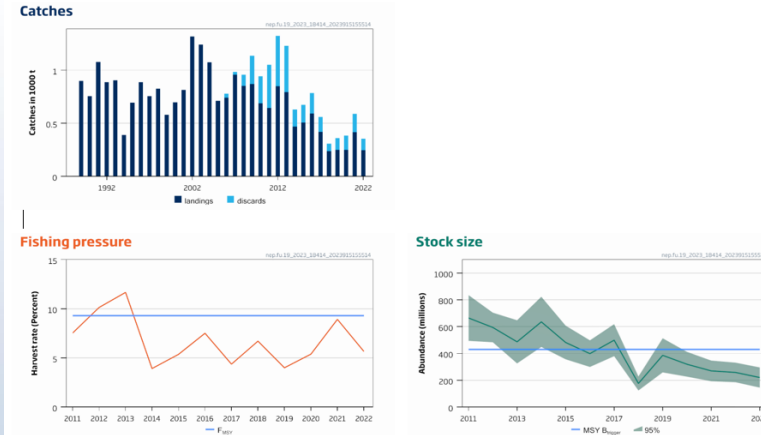

Figure 1 Norway lobster in divisions 7.a, 7.g, and 7.j, Functional Unit 19. Summary of the stock assessment. Catches (discards are only available from 2006 onwards), harvest rate (sum of landings and dead discards in numbers divided by stock abundance), and stock abundance (underwater TV survey).

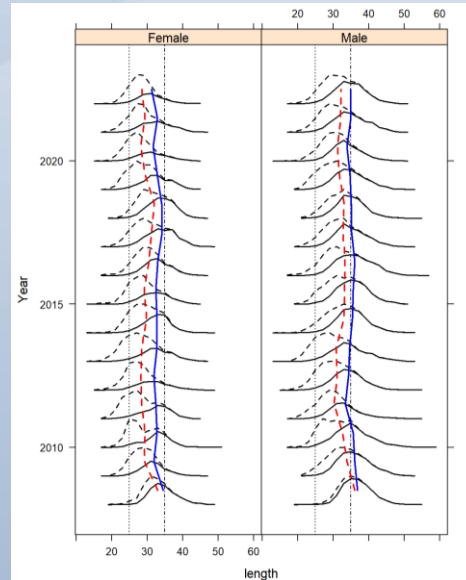

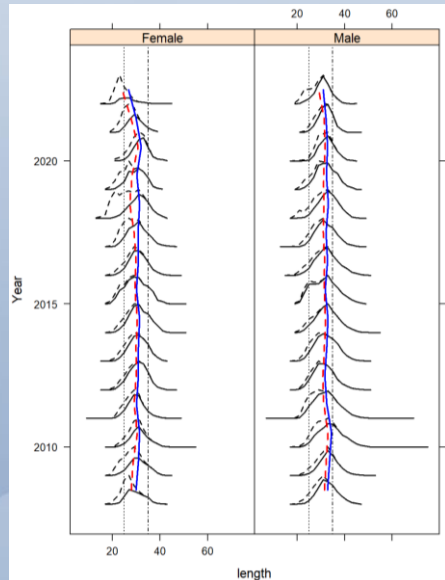

FU 20-21 - Labadie, Jones, Cockburn

Stock development over time

Fishing pressure on the stock is below F_{MSY} , and stock size is above $MSY B_{trigger}$.

Figure 1 Norway lobster in divisions 7.g and 7.h, functional units 20-21. Summary of the stock assessment. Catches (discard data only available from 2012), harvest rate (sum of landings and dead discards in numbers divided by stock abundance), and stock abundance (underwater TV survey).

Length–frequency distributions - mean length of catches (red, dashed) and landings (blue, solid)

FU16 - Porcupine

Stock development over time

Fishing pressure on the stock is above F_{MSY} , and no reference points for stock size have been defined for this stock.

Landings

Fishing pressure

Stock size

Figure 1 Norway lobster in divisions 7.b-c and 7.j-k, Functional Unit 16. Summary of the stock assessment. Landings (between 1979–2015 discarding is considered negligible; from 2016 onwards, discards are not quantified), harvest rate (sum of landings in numbers, divided by stock abundance), and stock abundance (underwater TV survey). The harvest rate in 2015 was calculated using an interpolated value for abundance, as no survey data are available. Harvest rates since 2016 may be underestimated because of the unknown discard levels.
